Single standard multimedia IF-PLL and FM radio demodulator

TDA9809M

FEATURES

- 5 V supply voltage
- Applicable at Intermediate Frequencies (IFs) of 38.9 and 45.75 MHz
- Gain controlled wideband Video IF (VIF) amplifier (AC-coupled)
- True synchronous demodulation with active carrier regeneration (very linear demodulation, good intermodulation figures, reduced harmonics, excellent pulse response)
- Robustness for over-modulation better than 105% due to PLL bandwidth control for negative modulation standards
- VIF AGC (Automatic Gain Control) detector for gain control, operating as peak sync detector for negative modulation standards
- Tuner AGC with adjustable TakeOver Point (TOP)
- AFC (Automatic Frequency Control) detector without extra reference circuit
- AC-coupled limiting amplifier for sound intercarrier signal
- Alignment-free FM PLL (Phase-Locked Loop) demodulator with high linearity; integrated de-emphasis resistor
- Integrated level detector
- Alignment-free FM radio AFC detector with external resonator
- RIF (Radio IF) amplifier for 10.7 MHz
- Stabilizer circuit for ripple rejection and to achieve constant output signals
- ESD (Electrostatic Discharge) protection for all pins.

GENERAL DESCRIPTION

The TDA9809M is an integrated circuit for single standard vision IF signal processing, FM demodulation and FM radio demodulation in multimedia sets.

ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
TDA9809M	SSOP20	plastic shrink small outline package; 20 leads; body width 5.3 mm	SOT339-1

Single standard multimedia IF-PLL and FM radio demodulator

FUNCTIONAL DESCRIPTION

The TDA9809M is comprised of the functional blocks shown in Fig.1:

- Vision IF amplifier and AGC detector
- Tuner (TV/radio) and VIF AGC
- Frequency Phase-Locked Loop (FPLL) detector
- VCO, Travelling Wave Divider (TWD) and TV AFC
- Video demodulator and amplifier
- Intercarrier mixer
- RIF amplifier and AGC detector
- FM-PLL demodulator, level detector and radio AFC
- Audio Frequency (AF) signal processing
- Internal voltage stabilizer
- Logic.

Vision IF amplifier and AGC detector

The vision IF amplifier contains three AC-coupled differential amplifier stages. Each differential stage includes a feedback network controlled by emitter degeneration.

The AGC detector generates the required VIF gain control voltage for constant video output by charging/discharging the AGC capacitor. The sync level of the video signal is therefore detected for negative video modulation.

Tuner (TV/radio) and VIF AGC

For TV operation, the AGC capacitor voltage is converted to an internal IF control signal and then fed to the tuner AGC to generate the tuner AGC output current at pin TAGC (open-collector output). The tuner AGC takeover point can be adjusted at pin TADJ. This allows the tuner to be matched to the SAW filter in order to achieve the optimum IF input level.

For FM radio operation, an AGC detector is provided to obtain some adjacent channel protection.

Single standard multimedia IF-PLL and FM radio demodulator

TDA9809M

Frequency Phased-Locked Loop detector (FPLL)

The VIF amplifier output signal is fed, via a limiting amplifier, to a frequency and phase detector. During acquisition, the frequency detector generates a DC current that is proportional to the difference in frequency between the input signal and the VCO signal.

After frequency lock-in, the phase detector generates a DC current proportional to the phase difference between the input signal and the VCO signal. The DC current generated by the frequency or phase detector is converted to a DC voltage via the loop filter, which controls the VCO frequency.

VCO, TWD and TV AFC

The VCO operates with a resonance circuit (with L and C in parallel) at double the Picture Carrier (PC) frequency. The VCO is controlled by two integrated variable capacitors. The control voltage required to tune the VCO from its free-running frequency to double the PC frequency is generated by the FPLL and fed via the loop filter to the first variable capacitor. This control voltage is amplified and converted into a current which represents the AFC output signal. At the centre frequency, the AFC output current is zero.

The TWD divides the oscillator signal by 2 and generates two differential output signals with a 90° phase difference independent of frequency.

Video demodulator and amplifier

Video demodulation is realized by a multiplier designed for low distortion and wide bandwidth. The vision IF input signal and the 'in-phase' signal of the travelling wave divider output are multiplied together.

The demodulated output signal is fed to the video amplifier via an integrated low-pass filter used to attenuate the carrier harmonics. This is an operational amplifier with internal feedback and wide bandwidth. A low-pass filter is integrated to attenuate the carrier harmonics. The video output signal at $V_{o(vid)}$ is 1.1 V (p-p) for nominal vision IF modulation, in order to achieve 1 V (p-p) at the sound trap output.

Intercarrier mixer

The intercarrier mixer is realized by a multiplier.

The sound IF signal passes through the vision IF SAW filter and the composite IF signal is then fed to the intercarrier mixer. Here, the IF signal is multiplied by the 90° TWD output signal to convert the sound IF to the intercarrier frequency. By using this quadrature detection, the low frequency video signals are removed. The mixer output signal is fed, via a high-pass filter used to attenuate the video signal components, at output pin 10.

RIF amplifier and AGC detector

The radio IF amplifier amplifies the 10.7 MHz radio IF signal. This signal is supplied by the tuner and is fed to the RIF input (pin 4) via a matching circuit and a ceramic band-pass filter. This amplifier contains two stages. The first stage, a conventional 0 dB differential amplifier designed for optimal dynamic range, is followed by a switchable differential amplifier stage with a gain of 10 dB. Either the radio IF or the TV IF signal can be selected at the output (pin 10).

The RIF output signal is fed via ceramic band-pass filters to the FM-PLL demodulator and the radio IF AGC detector. The AGC threshold is very high and is designed to obtain some adjacent channel protection. The AGC detector output is fed to the tuner AGC output stage (pin 12) to control the tuner.

FM-PLL demodulator, level detector and radio AFC

The FM-PLL demodulator consists of a limiter and an FM phase-locked loop. The 8-stage internally AC-coupled limiter amplifies and limits the TV FM sound intercarrier or the radio FM intermediate frequency signal prior to demodulation. The limiter is designed for high sensitivity and AM suppression with low DC offset and needs no external pins for DC coupling.

Furthermore, the AF output signal can be force muted by connecting a resistor between pin 11 and ground. The soft mute function can be disabled by connecting a resistor between pin 11 and the power supply. See the application circuit in Fig.16.

Single standard multimedia IF-PLL and FM radio demodulator

TDA9809M

The FM-PLL consists of an integrated relaxation oscillator, an integrated loop filter and a phase detector.

The oscillator is locked to the FM intercarrier signal output from the limiter. As a result of locking, the oscillator frequency tracks with the modulation of the input signal and the oscillator control voltage is superimposed on the AF voltage. The FM-PLL operates as an FM demodulator.

The level detector detects, rectifies and amplifies the output signals from the first 5 limiter stages. These signals are then summed and the composite signal passed through a low-pass filter, followed by a 6 dB output amplifier. A DC voltage dependent on the limiter input level is generated for controlling the behaviour of the AF soft mute. The 6 dB output amplifier can be switched off via the control logic and the level detector output signal fed to pin 14. Furthermore, the steepness of the level detector output signal tracks that of the power supply voltage.

The radio Automatic Frequency Control (AFC) stage is comprised of a 10.7 MHz phase shifting network, a phase detector (quadrature demodulator), a differential amplifier input stage (which receives the limiting amplifier output signal) and a current mode output stage.

A ceramic resonator is used for phase shifting. This permits alignment-free operation.

AF signal processing

The AF signal processing stage consists of a pre-amplifier for the FM-PLL demodulator output signal, an AF source selector, a soft and forced mute stage with an integrated time constant and an AF post-amplifier.

The FM demodulator output signal is pre-amplified by an operational amplifier (30 dB gain) with internal feedback, high gain and high common mode rejection. The feedback circuit, together with external capacitor C_{DEC} connected to pin 9, keeps the DC level at the pre-amplifier output constant (2.3 V). An external resistor connected in series with C_{DEC} provides a gain reduction capability.

The low-pass filter characteristic (130 kHz bandwidth) of the amplifier reduces the harmonics of the IF signal at the sound signal output.

Soft mute occurs when the internal level detector output voltage is lower than the mute threshold voltage at pin 8 (provided an external resistor is not connected between the limiter input, pin 11, and the supply voltage). The mute stage reduces the AF signal by 25 dB, with an internal time constant of approximately 7 ms.

If a resistor is connected between pin 11 and ground (forced mute), the mute stage will reduce the AF signal by more than 70 dB with the same time constant.

Otherwise, the AF signal will not be reduced.

The AF post-amplifier, which was designed to include a rail-to-rail output stage, provides the required AF output level at pin 7.

Internal voltage stabilizer

The bandgap circuit generates a voltage of approximately 1.25 V internally, independent of supply voltage and temperature. A voltage regulator circuit connected to this voltage generates a constant 3.6 V which is used as an internal reference voltage.

Logic

The logic circuit detects the logic levels and threshold voltages at ports LP0 and LP2 and controls the internal functions as described in Table 2.

Single standard multimedia IF-PLL and FM radio demodulator

TDA9809M

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_P	supply voltage (pin 19)	maximum chip temperature of 130 °C; note 1	–	5.5	V
V_n	input voltage at pins 1 to 9, 11, 12, 14 and 17 to 20		0	V_P	V
t_{sc}	short-circuit time		–	10	s
V_{TAGC}	tuner AGC output voltage		0	13.2	V
T_{stg}	storage temperature		–25	+150	°C
T_{amb}	ambient operating temperature		–20	+70	°C
V_{es}	electrostatic handling	note 2	–300	+300	V

Notes

- $I_P = 102$ mA; $T_{amb} = 70$ °C; $R_{th(j-a)} = 120$ K/W.
- Machine model class B ($L = 2.5$ μ H).

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air	120	K/W

CHARACTERISTICS

$V_P = 5$ V; $T_{amb} = 25$ °C; see Table 1 for input frequencies; input level $V_{i(VIF)(rms)} = 10$ mV (sync-level for B/G); $V_{i(FM)(rms)} = 10$ mV; IF input from 50 Ω via broadband transformer 1 : 1; video modulation DSB; residual carrier B/G: 10%; video signal in accordance with "CCIR, line 17" or "NTC-7 Composite"; test circuit in Fig.15 used for measurements; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supply (pin 19)						
V_P	supply voltage	note 1	4.5	5	5.5	V
I_P	supply current	TV mode	76	89	102	mA
		radio mode	29	35	41	mA
		power-down mode	5	8	11	mA
Television mode						
VISION IF AMPLIFIER (PINS 1 AND 2)						
$V_{i(VIF)(rms)}$	minimum vision IF input signal voltage (RMS value)	$f_{PC} = 38.9$ or 45.75 MHz; –1 dB video at output	–	60	100	μ V
	maximum vision IF input signal voltage (RMS value)	$f_{PC} = 38.9$ or 45.75 MHz; +1 dB video at output	120	200	–	mV

Notes

- Video and sound parameters are degraded at $V_P \leq 4.5 \text{ V}$.
- This parameter is not tested during production and is provided as application information for use in designing the television receiver.
- Loop bandwidth $BL = 70 \text{ kHz}$ (natural frequency $f_n = 12 \text{ kHz}$; damping factor $d \approx 3$; calculated for peak level). Resonance circuit of VCO: $Q_0 > 50$; $C_{\text{VCO}} = 8.2 \text{ pF} \pm 0.25 \text{ pF}$; $C_{\text{int}} \approx 8.5 \text{ pF}$ (loop voltage $\approx 2.7 \text{ V}$).
- Temperature coefficient of external LC circuit is equal to zero.
- $V_{i(\text{VIF})\text{(rms)}} = 10 \text{ mV}$; $\Delta f = 1 \text{ MHz}$ (VCO frequency offset related to picture carrier frequency); white picture video modulation.
- $V_{i(\text{VIF})}$ signal for nominal video signal.
- The leakage current of the AGC capacitor should not exceed $1 \mu\text{A}$ to avoid larger tilt.
- S/N is the ratio of black-to-white amplitude to the black level noise voltage (RMS value, pin 13). $B = 5 \text{ MHz}$ weighted in accordance with "CCIR 567".
- The intermodulation figures are defined:

$$\alpha_{\text{IM}(0.92/1.1)} = 20 \log \left(\frac{V_0 \text{ at } 3.58 \text{ (4.4) MHz}}{V_0 \text{ at } 0.92 \text{ (1.1) MHz}} \right) + 3.6 \text{ dB}; \alpha_{\text{IM}(0.92/1.1)} \text{ value at } 0.92 \text{ or } 1.1 \text{ MHz referenced to black/white signal;}$$

$$\alpha_{\text{IM}(2.76/3.3)} = 20 \log \left(\frac{V_0 \text{ at } 3.58 \text{ (4.4) MHz}}{V_0 \text{ at } 2.76 \text{ (3.3) MHz}} \right); \alpha_{\text{IM}(2.76/3.3)} \text{ value at } 2.76 \text{ or } 3.3 \text{ MHz referenced to colour carrier.}$$
- Measurements taken with SAW filter G1962 (sound shelf: 20 dB); loop bandwidth = 70 kHz.
 - Modulation VSB; sound carrier **off**; $f_{\text{video}} > 0.5 \text{ MHz}$.
 - Sound carrier **on**; SIF SAW filter K9453; $f_{\text{video}} = 10 \text{ kHz to } 10 \text{ MHz}$.
- Response speed valid for a VIF input level range of $200 \mu\text{V}$ up to 70 mV .
- A current source output is provided to match the AFC output signal to different tuning systems. The test circuit is given in Fig.6 for TV mode and in Fig.11 for radio mode. The AFC steepness can be changed by the resistors at pin 14.
 - A voltage output is provided to match the AFC output signal to different tuning systems. The DC load current should not exceed $180 \mu\text{A}$.
- Depending on the ratio $\Delta C/C_0$ of the LC resonant circuit of the VCO ($Q_0 > 50$; see note 3; $C_0 = C_{\text{int}} + C_{\text{ext}}$).

Single standard multimedia IF-PLL and FM radio demodulator

TDA9809M

14. The intercarrier output signal at pin 10 can be calculated with the following formula using the video output signal at pin 13 ($V_{o(\text{video})(p-p)} = 1.1 \text{ V}$ typical) as a reference:

$$V_{o(\text{rms})} = 1.1 \text{ V (p-p)} \times \frac{1}{2\sqrt{2}} \times 10^{\frac{\frac{V_{i(\text{SC})}(\text{dB}) + 6 \text{ dB} \pm 3 \text{ dB}}{V_{i(\text{PC})}}}{20}}$$

with $\frac{1}{2\sqrt{2}}$ = correction term for RMS value,

$\frac{V_{i(\text{SC})}}{V_{i(\text{PC})}}(\text{dB})$ = sound-to-picture carrier ratio at VIF input (pins 1 and 2) in dB,

6 dB = correction term of internal circuitry and $\pm 3 \text{ dB}$ = tolerance of video output and intercarrier output amplitude $V_{o(\text{rms})}$.

Example: SAW filter G1962 (sound shelf: 20 dB) $\Rightarrow \frac{V_{i(\text{SC})}}{V_{i(\text{PC})}} = -27 \text{ dB} \Rightarrow V_{o(\text{rms})} = 32 \text{ mV (typ.)}$.

15. Input level for second IF from an external generator with 50Ω source impedance. AC-coupled with 10 nF capacitor, $f_{\text{mod}} = 1 \text{ kHz}$, 27 kHz (54% FM deviation) of audio reference. A VIF/SIF input signal is not permitted. Pin 5 has to be connected to the positive supply voltage for minimum IF gain. S/N and THD measurements are taken at $50 \mu\text{s}$ (75 μs at M standard) de-emphasis (modulator pre-emphasis has to be activated). The FM demodulator steepness $\Delta V_{o(\text{AF})}/\Delta f_{\text{AF}}$ is positive.
- a) Second IF input level 10 mV (RMS).
16. Measured with an FM deviation of 27 kHz, the typical AF output signal is 500 mV (RMS) ($R_x = 0 \Omega$). By using $R_x = 680 \Omega$ the AF output signal is attenuated by 6 dB (250 mV RMS). For handling a frequency deviation of more than 53 kHz the AF output signal has to be reduced by using R_x in order to avoid clipping (THD < 1.5%). For an FM deviation up to 100 kHz an attenuation of 6 dB is recommended with $R_x = 680 \Omega$.
17. The leakage current of the decoupling capacitor (2.2 μF) should not exceed 1 μA .
18. For all S/N measurements, the vision IF modulator used must meet the following specifications:
- a) Incidental phase modulation for black-to-white jump less than 0.5 degrees.
- b) QSS AF performance, measured with the television-demodulator AMF2 (audio output, weighted S/N ratio) better than 60 dB (deviation $\pm 27 \text{ kHz}$) for 6 kHz sine wave black-to-white video modulation.
- c) Picture-to-sound carrier ratio; $\text{PC}/\text{SC}_1 = 13 \text{ dB}$; (transmitter).
19. The PC/SC_1 ratio at pins 1 and 2 is calculated as the addition of TV transmitter PC/SC_1 ratio and SAW filter PC/SC_1 ratio. This PC/SC_1 ratio is necessary to achieve the $\text{S}/\text{N}_{\text{V}}$ values as noted. A different PC/SC_1 ratio will change these values.
20. Measurements taken with SAW filter G1962 (sound shelf: 20 dB) for vision and sound IF.
21. The RIF amplifier output (pin 10) must be connected to a multistandard application ceramic filter for 5.5, 6.0 and 10.7 MHz. This total load constitutes an impedance of 250Ω .
22. d_3 tested using two signals with frequencies of $f_1 = 10.5 \text{ MHz}$ and $f_2 = 10.7 \text{ MHz}$, and with a level of $V_{i(4)(\text{max})(\text{rms})}$ for each signal. d_3 is the ratio of the intermodulation product at 10.3 MHz to the output level of $V_{i(4)(\text{max})(\text{rms})}$.
23. The control steepness of the radio AFC detector is dependent on the characteristic of the ceramic resonator, pin 18. The figure given here will be obtained when applying a typical resonator of the type CDA 10.7 MC1-A (Murata). The spread of the control steepness depends on the spread of the ceramic resonator characteristic (see Fig.11).

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "*IC Package Databook*" (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all SSOP packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

Wave soldering is **not** recommended for SSOP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The longitudinal axis of the package footprint must be parallel to the solder flow and must incorporate solder thieves at the downstream end.**

Even with these conditions, only consider wave soldering SSOP packages that have a body width of 4.4 mm, that is SSOP16 (SOT369-1) or SSOP20 (SOT266-1).

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

radio demodulator**

TDA9809M

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
